                                                                                                                                                                                                                                                                                                                                                                                                                                   NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/doss/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 22 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                         Worley, K.C.

It currently consists of 72 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 66 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                NOTE: This is a 'working draft' sequence. It currently consists of 72 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                  bp in length

                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                               The sequence is that of a clone encoding hek-L protein, a protein that can blind hek (a cell surface receptor tyrosine kinase). Hek-L is the first known ligand for hek and can be used to study cellular processes regulated by hek (which may be involved in tumorigenesis). It is also an immunogen for antibody production, as a reagent for hek proteins, to purify hek proteins, and to carry diagnostic or cytocoxic agents to particular leukaemia cells that express the hek antigen. Hek-L also binds the elk tyrosine kinase receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GGATCTTGGAACGAGGCCTGCTGGAGAAGCCGGGAGCGCGGGGCTCAGTCGGGGGGC

                                                                                       The DNA encodes an Eph transmembrane tyrosine kinase family ligand designated Ef1-2. Ef1-2 is useful for identifying other ligands for Ehk-1, -2, -3, Eck and Elk receptors. The ligands are useful in promoting a differential function and/or influencing the phenotye, such as growth and/or proliferation, of receptor bearing cells. They may be used in the diagnosis, and treatment of neurological disorders.

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTs are not well suited for isolating CDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length CDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CDNA isolation;

The invention relates murine and human LERK-6 polypeptides that bind to hek/elk receptors. Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the enhancement, stimulation, proliferation or growth of cells expressing the neural growth, development and/or maintenance. LERK-6 can be used for treating disorders of neural tissue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating custodegenerative conditions where there is neural death, excitotoxicity. In addition, they may be administered to a mammal to exert a trophic effect on neural tissue. They can also be used as reagents for those conducting quality assurance studies e.g. to monitor shelf life and stability of elk protein under different conditions. The polypeptides can also be used as carriers for delivaring agents attached to cells bearing than a trophic also be used as carriers for delivaring agents attached to cells bearing the elk or her elevance receptor. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                           LERK-6 polypeptide; hek receptor; elk receptor; human; murine; injury; cell proliferation; neural growth; neural tissue; neurological disease, neurodegenerative; excitotoxicity; ss.

It was obd. from a day-3 chick embryo cDNA library using mouse Elf-1 cDNA (see AAT15008) as probe. The cDNA can be used for the prodn. of recombinant Elf-1, in the breeding of transgenic animals,

The present sequence encodes an avian EPH receptor ligand designated Elf-1. This ligand can bind to both mek-4 and sek-AP. Elf-1 is a tyrosine kinase ligand, which is linked to the membrane through a phosphatidylinositol linkage. It shares some homology to 2 other EPH receptor ligands, B61 and LERK-2. The Elf-1 protein modulates proliferation, differentiation and survival of EPH receptor-expressing cells by stimulating or antagonising intracellular signalling mediated by the EPH receptor. Typical of many potential applications are increasing survival of neuronal cells in culture (e.g. where intended in
                                                                                                                                                                                                                                                                                                                                                                                           transplantation), also therapeutically in increase neuron survival (e.g. treatment of Alzheimer's or Parkinson's diseases), to prevent nervous system and lymphatic tumours, to induce differentiation of hepatocytes to form an artificial liver, to induce cartilage and bone

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                        A mouse cDNA clone (AAT15008) codes for a novel EPH receptor ligand, Elf-1 (AAR94766), involved in the formation and maintenance of ordered spatial arrangements of differentiated tissue. It was obtd. from an embryo mid- and hind-brain cDNA expression library using a receptor affinity probe technique with mek4-AP and sek-AP (AP = alkaline phosphatase) reagents. The cDNA is used for the prodn. of recombinant Elf-1, in the breeding of transgenic animals, the rhe design of diagnostic probes, and for gene (or antisense) therapy of cellular and tissue disorders.
                                                                         Murine and chicken EPH receptor ligand, {\rm Elf}-1 - useful in diagnosis and treatment of disorders associated with the {\rm Elf}-1 gene, e.g. dementia, tachycardia , etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              233 cgagggagcgagcgcgcggcagcaccggggccatggcgccggcgcagcgccgctgctgc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes a mammalian EPH receptor ligand designated Elf-1. This ligand can bind to both mek-4 and sek-AP. Elf-1 is a tyrosine kinase ligand, which is linked to the membrane through a phosphatidylinositol linkage. It shares some homology to 2 other EPH receptor ligands, B61 and LERK-2. The Elf-1 protein modulates proliferation, differentiation and survival of EPH receptor-expressing cells by stimulating or antagonising intracellular signalling mediated by the EPH receptor. Typical of many potential applications are increasing survival of neuronal cells in culture (e.g. where intended for transplantation), also therapeutically in increase neuron survival e.g. treatment of Alzheimer's or Parkinson's diseases), to prevent nervous system and lymphatic tumours, to induce differentiation of hepatocytes to form an artificial liver, to induce cartilage and bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     53 CGGGGGGGGGGGGGGGGGGCTCCGGGG--ATGGCGGCGCTCCGCTGCTGCTGCTGC 110

The protein may also be used as a delivery agent, taking diagnostic and therapeutic agents to cells expressing such receptors. LERK-6 can also be used as a tissue culture reagent to enhance the viability or prolong the lifespan of the neurons. Neural tissue disorders and injuries may

The invention relates murine and human LERK-6 polypeptides that bind to hak/elk receptors. Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the production of the proteins. LERK-6 polypeptides may be useful in the enhancement, stimulation, proliferation or growth of cells expressing the hex or elk receptor. The ligand and receptor complex may be involved in neural growth, development and/or maintenance. LERK-6 can be used for treating disorders of neural tissue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating neurodegenerative conditions where there is neural death, excitotoxicity. In addition, they may be administered to a mammal to exert a trophic effect on neural tissue. They can also be used as reagents for those conducting quality assurance studies e.g. to monitor shelf life and stable be used as carriers for delivering agents attached to cells bearing the elk or hek cell surface receptor. The present sequence represents a conduction under different conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              515

The LERK-6 polypeptide encoded by this sequence can be used to isolate cells expressing hek/elk cell surface receptors, or to measure the biological activity of such receptors. The protein may also be used as a delivery agent, taking diagnostic and therapeutic agents to cells expressing such receptors. LERK-6 can also be used as a tissue culture reagent to enhance the viability or prolong the lifespan of the neurons. Neural tissue disorders and injuries may
                                                                                                                                                                                                                                                                                                  1 DNA encoding cytokine designated LERK-6 which binds to cell surface receptors - useful for drug delivery and

                                                                                                                                                                                                                                                                                                                                                                                                                                 ä
                                                                                                                                                                                                                                           A fragment of murine Lerk-6 DNA was isolated by PCR for use as a probe for a human Lerk-6 homologue. The probe however led to the identification of a human Lerk-7 gene (see AA713269). The Lerk-7 gene and protein can be used for studying the role of Lerk-7 in conjunction with elk, hek and eck receptors. They can also be used for delivering diagnostic or therapeutic agents to cells, e.g. cancer cells. The Lerk-7 proteins can also exhibit neuroprotective or neurotrophic properties and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates murine and human LERK-6 polypeptides that bind to hek/elk receptors. Host cells transfected or transformed with vectors comprising the LERK-6 nucleic acid sequences are used for the recombinant production of the proteins. LERK-6 polypeptides may be useful in the enhancement, stimulation, proliferation or growth of cells expressing the chancement, stimulation, proliferation or growth of cells expressing the neural growth, development and/or maintenance. LERK-6 can be used for treating disorders of neural tissue such as injury or neurological diseases, either chronic or acute. LERK-6 may be employed in treating neural growth, they may be administered to a mammal to exert a trophic of fect on neural tissue. They can also be used as reagents for those conducting quality assurance studies e.g. to monitor shelf life and stability of elk protein under different conditions. The polypeptides can also be used as carriers for delivering agents attached to cells bearing the oll or her elby a minitor level.
                                                                                                                                                                                                                    LERK-6 polypeptide; hek receptor; elk receptor; human; murine; injury; cell proliferation; neural growth; neural tissue; neurological disease; neurodegenerative; excitotoxicity; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 555 BP; 102 A; 191 C; 151 G; 111 T; 0 other;

```
Poly(A)+ mRNA isolated from human umbilical vein endothelial cells (HUVE) was treated with TNF cyclohexamide and used to construct a lambda gill cDNA library. The library was screened using radiolabelled cDNA fragments derived from the 5' end of B61 DNA. Hybridising cDNA inserts were isolated and subcloned into pGEM 7zf Hybridising cDNA inserts were isolated and subcloned into pGEM 7zf Hybridising cDNA inserts were isolated and subcloned into pGEM 7zf + for sequencing. Clone B61.1 contained the entire OFR encoding a protein of 205 residues (24 kb). The B61 gene is involved in early inflammatory response and serves as a marker. It may be detected by probes or by antibody-based immunoassay of biological fluids such as plasma, CSF or urine. These assays make it possible to predict a worsening in a disease process and allow the quantitative assessment of the magnitude of the inflammatory response. This information will allow the earlier admin. Of appropriate therapy, thereby shortening the disease process and limiting the patient's exposure to anti-inflammatory/immunosuppressive therapy. B61 induction is rapid and profound, hence it is easily detectable. The B61 response is highly specific to proinflammatory stimuli, being only made by cells exposed to lipopolysaccharides or cytokines such as IL-2 and TNF and not growth factors or interferon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           λq

The N-terminal sequence of EBP isolated from the conditioned medium of the SK-BR-3 cell line was identical to the N-terminal amino acid sequence predicted from the expression of the B61 gene (Holzman et al., Mol. Cell Biol. 10, 5830 (1990); WO9207094).

CDNA encoding EBP having the N-terminal and sequenced and, as expected, found to be identical to the B61 gene. The EBP gene expressed in CHO cells resulted in at least two The EBP gene expraying different mol. Wts. C-terminal sequencing revealed only the sequence KRLAA-COOH which indicated a polypeptide of 150 amino acids (EBPI-150).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       317 CCCGGAGGCGGGCCAGAGCAGTACGTGCTACATGGTGAGCCGCAACGGCTACCGCACC 376
